

SPARKBILLS · SPARKCURV TECHNOLOGIES

Sparkbills

Product Explanation, Module Reference & Business Scenarios

This document is the complete owner-manual for Sparkbills. It explains what the product does, walks through every module screen-by-screen, gives concrete input/output examples, and closes with six end-to-end business scenarios showing exactly how a real business would run its day inside the app.

Document	SB-DOC-01
Version	1.1
Revision Date	2026-07-19
Vendor	SparkCurv Technologies Pvt. Ltd.
Contact	admin@sparkcurv.in
Audience	Business owners, IT admins, DevOps

1. What is Sparkbills — and the problem it solves

Most Indian SMBs use **three or four different tools** to run their business: one to bill customers, one to do inventory, one to file GSTR-1/3B, and Excel for everything else. Every month the owner is left reconciling figures between them, which invariably leads to filing errors, mismatched stock, and unhappy CAs.

Sparkbills replaces all of that with **one browser-based application**. A single install (either on a cloud server or on a shop counter PC) is enough for the whole business, including multi-branch operations. The moment you sign up you get:

- A GST-compliant invoice with CGST / SGST / IGST / CESS split, HSN / SAC, e-Way Bill and IRN fields, and a UPI-QR on the PDF.
- A POS designed for your industry: 3-column restaurant POS with KOT, retail POS with barcode scanner, hospital OPD, pharmacy batch/expiry.
- Automatic vouchers & ledgers — every receipt, payment, expense or journal entry is captured with double-entry semantics.
- Live financial reports — P&L, Balance Sheet, Trial Balance without any accountant intervention.
- One-click GSTR-1 and GSTR-3B tables that map exactly to the government portal.
- Cashier shifts with cash reconciliation to catch shortages the same day, not at month-end.

Sparkbills is **multi-industry** — the same install works for a grocery shop, a restaurant, a hospital OPD, a pharmacy, or a service company. Business owner switches industry from the top-left dropdown and the sidebar / dashboard adapt to that industry.

2. Who is it for — industries and roles

Below is the industry-role matrix that guides the UI/workflow choices.

Industry	Typical size	Modules that light up	Compliance focus
Retail / kirana / supermarket	1 – 3 counters	POS with barcode, item variants, price labels, Vouchers	GST 5-28%, HSN, MRP labelling
Restaurant / cafe / bar	10 – 60 seats	3-column POS, table map, KOT/KDS, add-ons & variants, Swiggy / Zomato	GST 5%, service charge, aggregator settlement
Hospital / clinic	OPD + optional IPD	Patients, Doctors, Appointments, Rooms, OPD billing	Bill of Supply for health services (GST-exempt)
Pharmacy / medical store	Single counter + storeroom	Batch & expiry tracking, FEFO stock allocation, low-stock alerts	GST 5-12% on medicines, Schedule H
Service company / consultant	1 – 20 employees	Quotations, proforma, recurring invoices, TDS/TCS on invoices	SAC codes, TDS 194J/194C, reverse charge

Industry	Typical size	Modules that light up	Compliance focus
Wholesaler / distributor	Multi-branch	Purchase bills, supplier ledger, credit note flow, branch transfer	IGST for inter-state, GSTR-1 B2B, e-Way Bill > ₹50k

Roles inside a single business are separated so a cashier cannot see the P&L and a doctor cannot delete invoices. See **Section 8** for full permissions matrix.

3. System architecture (bird's-eye view)

Sparkbills is a two-tier web application:

- **Frontend:** React 19 + Tailwind + shadcn-ui, served as a static bundle by Nginx (production) or the Node dev-server (local).
- **Backend:** FastAPI (Python 3.12) with async Motor + PyMongo drivers, running on Uvicorn behind Nginx as a reverse proxy on /api/*.
- **Database:** MongoDB 7 with UUID-string primary keys, atomic counter collection for invoice numbering, and per-tenant scoping via `business_id` on every document.
- **Email:** Managed Emergent Email integration — Sparkbills sends via a single endpoint, provider is abstracted.
- **PDF engine:** ReportLab for A4 tax invoice + Thermal 80mm receipt + CODE128 barcode label sheet.
- **Auth:** JWT bearer tokens, bcrypt hashing, refresh tokens in httpOnly cookies, 24 h access-token lifetime.

All communication between browser and server is HTTPS in production. The backend never exposes MongoDB directly — it lives on 127.0.0.1:27017 and only the FastAPI process on the same host can reach it.

4. Getting started — first-run checklist

On a fresh install, the very first login is with the seeded owner account. Do these six things before anything else:

1. Log in with `admin@sparkcurv.in` / `Admin@2026`.
2. Go to **Settings** → **Users** and immediately change the password. Use a passphrase, not a word.
3. Go to **Settings** → **Business** and fill in: legal name, GSTIN, state, address, phone, UPI ID, invoice prefix and FY start month.
4. Go to **Settings** → **Branches** and add each physical branch/counter. Every branch gets its own state and GSTIN.
5. Go to **Products / Items** and either add products manually or import CSV (Retail/Wholesale) — use *menu* type for restaurants, *medicine* for pharmacies with expiry.
6. Go to **Customers** and add at least one anchor customer (walk-in customers can also be captured on-the-fly during billing).

Note: The seeded account is an **Owner**, which has full access including backup / restore. Do not use it for daily cashier work — create a cashier role user for each counter.

5. Module-by-module reference (screen by screen)

5.1 Dashboard

What it does: One-page pulse of the business — sales trend, cash-flow, receivables, payables, top products, and low-stock alerts, all filtered to the current fiscal window.

Key screens & actions:

- Five KPI cards: Total Sales, Total Purchases, Total Receivables, Total Payables, Net Profit — each with an up/down arrow vs the previous window.
- Sales Overview area chart (daily line) with a switch for This Week / This Month / This Quarter.
- Sales by Payment Mode donut (Cash / UPI / Card / Bank / Wallet).
- Top Selling Items leaderboard.
- Recent Invoices & Low Stock & Quick Actions (New Invoice / Purchase / Customer / Product / Receive Payment / Expense).

Inputs (what you type):

- No manual input. The dashboard is read-only and recomputed on every load.

Outputs (what the app does):

- Reads from invoices, purchase_bills, vouchers, items collections.
- Uses the current FY (default April–March) unless overridden in Settings.

Tips & edge cases:

- If Net Profit is red, drill into the P&L report to find whether it is a revenue or expense issue.
- If Receivables > two months of sales, run the Customer Ledger report and start dunning.

5.2 Sales — Invoices, Quotations, Credit / Debit Notes, Returns

What it does: The heart of the app. Every outward document lives here, uses the same line-item builder, and hits GSTR-1 automatically.

Key screens & actions:

- **New Invoice** button: pick doc-type (Tax Invoice / Bill of Supply / Non-GST / Quotation / Proforma / Credit Note / Debit Note / Sales Return).
- Customer picker with inline '+ new customer' option; place-of-supply auto-fills from customer state.
- Line item table: name (with product autocomplete), HSN, qty, rate, disc%, GST%, CESS%. GST split (CGST/SGST or IGST) is computed automatically from the state combo.
- **GST Compliance** collapsible — Reverse Charge toggle, TDS/TCS %, IRN + Ack, E-Way Bill No + Date, Transport Mode, Vehicle No.
- Summary card — Subtotal, Discount, Service Charge, CGST/SGST or IGST, CESS, RCM adjustment, TDS/TCS, Round-off, Grand Total.
- Buttons: Save Draft, Save & Print (A4), Save & Thermal, Email PDF.

Inputs (what you type):

- Customer (by search or new), items (search or scan barcode), amounts, discounts, taxes, payment methods (cash / UPI / card / bank / wallet / cheque / credit).

Outputs (what the app does):

- Doc number auto-generated: e.g. INV/2026-27/00218 based on your FY prefix.
- Stock reduces on Tax Invoice & increases on Sales Return.
- Ledger entries created in Customer Ledger, Cash Book / Bank Book, Sales register.
- PDF invoice with UPI QR generated in < 1 sec. Attach to Email is one click.

Tips & edge cases:

- For inter-state customers, IGST is charged (never CGST+SGST). Sparkbills detects this by comparing your GSTIN state to the customer's.
- 'Reverse Charge' excludes GST from the amount the customer pays — but it still shows in GSTR-3B 3.1(d).
- Round-off is toggleable per invoice. The rounding is to the nearest whole rupee.

5.3 POS — Retail

What it does: Fast till-side billing for shops that scan barcodes and take cash / UPI.

Key screens & actions:

- Barcode scanner input focused by default. Every scan adds the matched product.
- Numeric keypad for qty override.
- Quick-pick tiles for products without barcodes (bread, eggs, milk).
- One-tap payment split: full cash / full UPI / split.
- 'Hold' and 'Recall' support for parked bills.

Inputs (what you type):

- Barcode scan, manual qty, payment method.

Outputs (what the app does):

- Instant thermal 80mm receipt printed to the roll printer (if configured).
- Cash drawer opens (via ESC/POS or manually).
- Sale is added to the current cashier shift (variance tracking).

Tips & edge cases:

- Barcode not in the catalogue? A modal lets the cashier create the item on the fly (needs Manager approval when RBAC is on).

5.4 POS — Restaurant (3-column layout)

What it does: Category tabs, item grid, and the running order cart — the classic restaurant POS pattern with add-ons, variants and KOT dispatch.

Key screens & actions:

- Left column: menu categories (Starters, Mains, Beverages, Desserts...).
- Middle column: items in the selected category with veg / non-veg badge and price.
- Right column: current cart with qty steppers, running total, KOT button, Bill button.
- Tapping an item with add-ons or variants opens the **AddonPicker** dialog (checkboxes for cheese, extra sauce; radio for size).
- Table map for dine-in — assign order to Table 4, split-bill, transfer table.

Inputs (what you type):

- Table number, waiter name, order items, add-ons, KOT notes, payment split.

Outputs (what the app does):

- KOT printed to the kitchen printer (or shown on KDS screen).
- When served, order finalises and generates a tax invoice with 5% GST and optional service charge.

Tips & edge cases:

- Swiggy / Zomato orders arrive via webhook and appear as read-only KOTs (KOT-S-... / KOT-Z-...) — the platform commission is captured in the Settlement report.

5.5 Purchases

What it does: Record supplier bills so stock goes up, payables go up, and GST input credit flows to GSTR-3B.

Key screens & actions:

- **New Purchase Bill** form: supplier, bill no, bill date, place-of-supply.
- Line items with HSN, qty, purchase rate, GST%. Support for batch / expiry (pharmacy).
- TDS-on-purchase field for services (194C / 194J).
- Payment split (part-paid / on credit).

Inputs (what you type):

- Supplier, bill scan (optional attachment), line items, tax split, payment terms.

Outputs (what the app does):

- Stock qty increases per lot / expiry.
- Supplier ledger and Accounts Payable go up.
- Input tax credit flows to GSTR-3B 4(a).

5.6 Vouchers & Expenses

What it does: Every rupee that leaves or enters your account outside of an invoice/purchase.

Key screens & actions:

- 6 voucher types with auto-numbers: RV (Receipt), PV (Payment), EV (Expense), IV (Income), CV (Contra), JV (Journal).

- Category dropdown for expenses (rent, salary, utilities, marketing).
- Method: cash / UPI / bank / card / wallet / cheque.
- Attach a scanned bill or a screenshot.

Inputs (what you type):

- Date, party (optional), amount, category, method, description.

Outputs (what the app does):

- Cash / bank balance updates in real-time.
- Cash Book and Cash Flow report reflect the entry.
- P&L shows expenses grouped by category.

5.7 Ledger & Cash Flow

What it does: The read-only reports that a CA usually asks for at year-end.

Key screens & actions:

- Cash Book: opening + all cash movements + closing, ordered by date.
- Cash Flow: monthly bar chart of net cash + inflow / outflow rows.
- Customer Ledger: per-customer opening balance + all invoices + all receipts + closing.
- Supplier Ledger: mirror of the above for payables.
- Expenses Summary: donut by category with drill-down.

Inputs (what you type):

- Date range picker, party selector (for customer/supplier ledgers).

Outputs (what the app does):

- Downloadable as CSV / PDF.

5.8 Stock Operations

What it does: Adjust stock for damage / correction and move stock between branches.

Key screens & actions:

- **New Adjustment:** item, qty delta (positive or negative), reason (damage, correction, opening stock).
- **New Transfer:** from-branch, to-branch, item(s), qty. Source stock decreases, destination stock increases atomically.

Inputs (what you type):

- Item, qty, reason. Optional bill scan for damage claims.

Outputs (what the app does):

- Stock quantities update immediately.
- Audit trail in stock_adjustments and stock_transfers collections.

5.9 Cashier Shift

What it does: Open a shift with a cash float, take orders all day, close with the actual counted cash and Sparkbills tells you if you are over or short.

Key screens & actions:

- **Open Shift:** enter opening float (■), optional notes.
- During the shift the top card shows Expected Cash, live payments-by-method table.
- **Close & Reconcile:** enter actual counted cash + cash deposited to safe/bank.
- Toast tells you variance in real time (over / short / perfect).

Inputs (what you type):

- Opening float, cash deposits, actual cash counted, close notes.

Outputs (what the app does):

- Shift becomes read-only, variance recorded, appears in Recent Shifts table.
- History table shows every past shift with cashier name, sales total, expected, actual, variance.

5.10 GST & Financial Reports

What it does: One-tap outputs that map to a filing or an auditor question.

Key screens & actions:

- GSTR-1: B2B, B2C, Rate-wise summary with CESS.
- GSTR-3B: 3.1(a) Outward taxable, 3.1(d) RCM, 4(a) ITC.
- HSN summary for GSTR-1 annexure.
- Sales summary by day / month.
- Aggregator Settlement (Swiggy / Zomato).
- P&L, Balance Sheet, Trial Balance.

Inputs (what you type):

- Date range.

Outputs (what the app does):

- Downloadable as PDF / CSV. Copy-paste rows into the GSTN portal.

5.11 Notifications (Email invoice)

What it does: Send the current invoice PDF to the customer's email in one click.

Key screens & actions:

- Mail button on Invoice Detail → enter customer's email → Send.
- Notifications tab in Settings shows history + status (sent / failed).

Inputs (what you type):

- Recipient email, optional custom subject / message.

Outputs (what the app does):

- PDF attached, delivery via managed provider.
- If attachment is rejected (rare), HTML-only fallback is sent and a toast tells the user.

5.12 Settings & Admin

What it does: Business profile, branches, users & RBAC, audit log, backup / restore, integrations (Swiggy / Zomato webhook URL).

Key screens & actions:

- Business tab: name, GSTIN, state, address, UPI ID, invoice prefix, FY start.
- Branches tab: add / edit / mark default.
- Users tab: invite, assign role, disable.
- Audit Log tab: every create/update/delete with actor + timestamp.
- Integrations tab: copy the Swiggy / Zomato webhook URL, simulate a test order.

Inputs (what you type):

- Business, branch and user config.

Outputs (what the app does):

- Everything written to MongoDB, audit-logged.

6. End-to-end business scenarios (six real days)

Each scenario below is a one-day walkthrough of an owner using Sparkbills. Screen names in **bold** match the sidebar labels.

6.1 Retail Grocery — daily billing + end-of-day cash reconciliation

Character: Ravi, cashier at a 2-counter kirana. He starts his shift at 8am with ₹2,000 in the drawer and closes at 9pm.

1. 8:00am — Ravi opens **Cashier Shift** and enters opening float = ₹2,000. A green 'Shift Open' badge appears.
2. 9:15am — A customer arrives with a trolley. Ravi opens **Retail POS**, scans 12 items with the USB scanner — each scan adds the correct product with GST rate.
3. Ravi applies a 5% loyalty discount, adds a 'Home delivery' service line at ₹25. Grand total: ₹1,864.
4. Customer pays ₹900 in cash and ₹964 by UPI (scans the UPI QR on the invoice). Ravi records the split payment.
5. Thermal 80mm receipt prints instantly. Invoice number auto-increments to INV/2026-27/00034.
6. 12:30pm — A different customer wants a return of a defective 5L oil can. Ravi opens the original invoice → clicks **Create Credit Note** → adds only that line. Stock goes back up, refund of ₹620 UPI is triggered from the same Payments panel.
7. 3:00pm — Ravi records a supplier payment (electricity bill ₹3,400) as a Payment Voucher (PV-00019) with method = UPI.
8. 9:00pm — Ravi hits **Close Shift**. The dialog pre-fills Expected Cash = ₹2,000 opening + ₹18,300 cash sales – ₹3,400 electricity = ₹16,900.
9. Ravi counts the drawer: ₹16,850. He enters that. Sparkbills says: **Short by ₹50**, records the variance, and closes the shift.
10. The owner sees 'short by ₹50' in the Shift History and asks Ravi to check — a mistake at 11am (gave ₹50 extra change).

6.2 Restaurant — dine-in + Swiggy + settlement

Character: Anita, manager of a 40-seat cafe.

1. 12:00pm — Table 4 seats 3 diners. Anita opens the **Restaurant POS**, selects Table 4, and taps: 1 Paneer Butter Masala (adds Extra Cheese ₹30 via AddonPicker); 2 Butter Naan; 1 Masala Chai (small variant).
2. She sends **KOT #KOT-D-00092** to the kitchen printer. Kitchen sees the order on the KDS in real time.
3. 12:30pm — While serving, a Swiggy order lands via webhook (Sparkbills receives POST /api/webhooks/swiggy). A new **KOT-S-00047** appears in the KDS with the delivery boy's name and platform order ID.
4. 1:15pm — Table 4 asks for the bill. Anita clicks **Bill**, adds 5% service charge, splits payment: ₹600 UPI + ₹300 card. Thermal receipt prints.
5. Swiggy order is auto-billed and included as an aggregator invoice with platform commission tracked separately.

6. End of day — Anita opens **Reports** → **Aggregator Settlement**. It shows: Swiggy gross ■42,180, commission ■9,240, net payout ■32,940 (of which ■28,500 already settled, ■4,440 pending).
7. Anita opens **Reports** → **P&L** and confirms today's Revenue ■68k, COGS ■19k, Expenses ■7k, Net Profit ■42k.

6.3 Pharmacy — RCM purchase + FEFO stock allocation

Character: Suresh, owner of a single-counter pharmacy.

1. 10:00am — Delivery of 500 strips Paracetamol from a small unregistered supplier arrives. Suresh opens **Purchases** → **New Bill**.
2. In the **GST Compliance** section he ticks *Reverse Charge* (because the supplier is unregistered, the pharmacy has to remit the GST directly).
3. He enters batch B27-A, expiry 2028-08, MRP ■18. Total taxable ■2,200 + 12% GST ■264 (RCM). Payment: on-credit.
4. Stock goes up by 500 strips. Payables ledger updates.
5. 2:00pm — A customer buys 10 strips. The POS auto-picks the earliest-expiring batch (FEFO). Any batches expiring within 30 days flash amber in the **Low Stock & Expiry Alerts** on the Dashboard.
6. Month-end — The RCM tax appears in **Reports** → **GSTR-3B** under 3.1(d) and is included in the eligible ITC list.

6.4 Service company — recurring invoicing with TDS deduction

Character: Priya, accountant at a digital agency invoicing a corporate client monthly.

1. Priya creates a Tax Invoice: SAC 998314 (IT services), ■1,00,000 taxable, 18% GST = ■1,18,000 gross.
2. The client is liable to deduct 2% TDS under 194J. Priya opens **GST Compliance**, enters **TDS 2%**.
3. Grand total becomes ■1,15,640 (= ■1,18,000 – ■2,360 TDS). Sparkbills records the ■2,360 as 'TDS Deducted' in the Customer Ledger, tagged for 26AS reconciliation.
4. Client pays ■1,15,640 via NEFT. Priya records the receipt against the invoice; the customer's outstanding balance goes to zero.
5. Come July, when the CA downloads the client's 26AS, the ■2,360 credit is matched against Sparkbills' TDS-deducted list — making refund / adjustment trivial.

6.5 Hospital OPD — consultation + labs (GST-exempt)

Character: Dr. Reddy's OPD front-desk clerk.

1. Patient walks in. Clerk registers them in **Hospital** → **Patients** (name, age, gender, phone). A UHID is auto-generated.
2. Doctor writes the prescription in **OPD**. Clerk adds Consultation ■500 + 2 labs (■300 + ■700) = ■1,500.
3. Clerk clicks **Save & Print** as a *Bill of Supply*. The A4 PDF is generated with 'GST NOT APPLICABLE' header and no tax break-up (health-care services are GST-exempt).

4. Payment: UPI ₹1,500. Patient's balance is zero.
5. Month-end — In **Reports** → **Sales Summary** this shows under Bill-of-Supply revenue and does NOT appear as GSTR-1 tax liability.

6.6 Wholesaler — inter-state with E-Way Bill

Character: Vinod, distributor shipping goods from Karnataka to Maharashtra.

1. Vinod raises a Tax Invoice: buyer in Maharashtra, taxable ₹62,000. Because it is inter-state, Sparkbills automatically applies **IGST 18%** = ₹11,160. Grand ₹73,160.
2. Because the value is > ₹50,000, an E-Way Bill is mandatory. Vinod visits the NIC EWB portal, generates EWB-234567891234, and pastes it into the **E-Way Bill No** field + transport mode = *Road* + vehicle KA-01-AB-1234.
3. The A4 PDF invoice now prints EWB number and vehicle in the compliance strip.
4. Vinod emails the PDF to the buyer with one click.
5. GSTR-1: the invoice appears under B2B with IGST split. E-Way Bill number is available for cross-check.

7. Reports catalogue and regulation mapping

Report	What it answers	Regulation / audience	Where
Dashboard KPIs	How is today / this month?	Owner daily view	Home
GSTR-1	What did I sell + tax collected?	GSTN monthly filing	GST & Reports
GSTR-3B	Net GST payable this month?	GSTN monthly filing	GST & Reports
HSN Summary	HSN-wise sale for GSTR-1 12	GSTN monthly annexure	GST & Reports
Cash Book	Daily cash movement?	Auditor / CA	Ledger & Cash Flow
Cash Flow	Am I bleeding cash?	Owner monthly	Ledger & Cash Flow
Customer Ledger	How much does X owe me?	Sales team / dunning	Ledger & Cash Flow
Supplier Ledger	How much do I owe Y?	Payables clerk	Ledger & Cash Flow
P&L	Am I profitable this year?	Owner / auditor annual	GST & Reports
Balance Sheet	Net worth of business?	Annual audit / bank loan	GST & Reports
Trial Balance	Do my books balance?	Auditor / CA	GST & Reports
Aggregator Settlement	How much has Swiggy paid me?	Restaurant owner weekly	GST & Reports
Shift Report	Cash-drawer variance today?	Cashier / owner nightly	Cashier Shift

8. Access control and roles

Role	Create invoice	Purchase	Vouchers	Reports	Settings
Owner	Y	Y	Y	All	All
Manager	Y	Y	Y	All except audit	Users only
Cashier	Y (POS only)	-	Receipt only	None	-
Accountant	Y	Y	Y	All except audit	-
Doctor	Consultation only	-	-	Own patients	-
Pharmacist	Pharmacy POS	Y	-	Stock, GSTR	-

9. Data model & retention

MongoDB collections (all scoped by business_id):

- businesses, branches, counters, users, audit_logs
- customers, suppliers, items, categories
- invoices (all outward docs, discriminated by doc_type), purchase_bills
- vouchers, stock_adjustments, stock_transfers
- kots, tables, patients, doctors, appointments, rooms
- aggregator_orders, notifications, shifts, counters_seq

Data retention: no automatic purging — keep as long as your CA requires (GST Act mandates 8 years). Daily backups recommended (see the Installation guides).

10. Default credentials and change procedure

Login URL	https://&lt;your-domain>/login
Email	admin@sparkcurv.in
Password	Admin@2026
Role	owner
Business	SparkCurv Technologies (seeded)

How to change: Log in → Settings → Users → click your own row → Change Password → enter a strong passphrase (16+ characters, mix upper/lower/number/symbol).

Important: Do not share this default password. Change it on the very first login of every new deployment.

11. What is intentionally excluded

The following modules are NOT in Sparkbills. If a client asks, SparkCurv can build them as separately-priced add-ons:

- AI features (auto-forecasting, chatbot).
- HR & Payroll (attendance, PF, ESI, salary sheet).
- Manufacturing / Production Bill-of-Material.
- E-commerce storefront (Sparkbills is the back-office; use Shopify/WooCommerce for the shop).

12. Roadmap — Phase 4 and beyond

- **Recurring invoices** — auto-generate monthly bills for service businesses.
- **Insurance / TPA hospital billing** — split-payer, claim tracking.
- **GSTR-2A reconciliation** — upload GSTR-2A JSON, match against purchase bills.
- **Offline POS** — IndexedDB queue with online sync (for weak-internet locations).
- **Multi-currency** — for exporters (INR base + USD invoicing).

13. Glossary

Term	Meaning
ACK No	E-invoice acknowledgment number returned by the NIC IRP portal.
Bill of Supply	GST-exempt or composition-scheme invoice; no tax break-up.
CESS	Compensation cess on luxury/sin goods (tobacco, aerated drinks, cars).
CGST/SGST/IGST	Central / State / Integrated GST. Intra-state = CGST+SGST; inter-state = IGST.
E-Way Bill	Mandatory transport document for goods movement > ₹50k.
FEFO	First-Expiry-First-Out: pharmacies dispense the earliest-expiring stock first.
HSN / SAC	6- or 8-digit product / service classification code required on invoices.
IRN	Invoice Reference Number generated by the NIC e-invoicing portal.
KOT	Kitchen Order Ticket — restaurant kitchen instruction.
RCM	Reverse Charge Mechanism — buyer pays GST directly to government.
TDS / TCS	Tax Deducted / Collected at Source under Income Tax Act.

For product questions, custom development or SLA options, contact admin@sparkcurv.in.
